

What is Neural Network?

What is Neural Network?

- Simulating Human Neurons to make Artificial Brain
- Each Inputs have A Weight
- Each Neurons have A Bias

$$(x_1 \times w_1) + (x_2 \times w_2) + (x_3 \times w_3) + b$$

$$= wx+b$$

$$f(wx+b) \text{ // } f(x) = \text{activation function}$$

Activation Function

1) Sigmoid

$$\frac{1}{1+e^{-t}}$$

$$1.0 / (1.0 + \text{np.exp}(-x))$$

COMMONLY USED ON NEURAL NETWORK!

2) Step Function

$$f(x) = \begin{cases} 0 & \text{for } x < 0 \\ 1 & \text{for } x \geq 0 \end{cases}$$

[0보다 작으면, 0을 반환한다 (음수)]
0보다 x가 큰 경우에는 1을 반환한다

3) Rectified Linear Unit (ReLU)

$$f(x) = \begin{cases} 0 & \text{for } x < 0 \\ x & \text{for } x \geq 0 \end{cases}$$

Benefits when USE Relu Function

이러한 ReLu가 가지는 이점은 다음과 같다.

1. Sparse activation : 0이하의 입력에 대해 0을 출력함으로 부분적으로 활성화 시킬수 있다.
2. Efficient gradient propagtion : gradient의 vanishing이 없으며 gradient가 exploding 되지 않는다.
3. Efficient computation : 선형함수이므로 미분 계산이 매우 간단하다.
4. Scale-invariant :

$$\max(0, ax) = a \max(0, x)$$
